Solid Figures

<p>A polyhedron figure with flat faces that are polygons is called a <u>Polyhedron</u>.</p>	
<p>A <u>Prism</u> is a solid figure that has 2 congruent Polygons as bases. All other faces of a prism are rectangles. Prisms are named by the polygons that form their bases.</p>	 <p>Hexagonal Prism</p>
<p>A <u>Pyramid</u> is a Polyhedron with only one base. All of the other faces are Triangles that meet at the same vertex. The pyramid is named for the polygon that forms its base.</p>	 <p>Pentagonal Pyramid</p>
<p>A solid with curved surfaces is not a Polyhedron. A <u>cylinder</u> has two flat circular bases and one curved surface. A <u>cone</u> has one flat circular base and one curved surface. A <u>Sphere</u> has no bases and one curved surface.</p>	 <p>Cylinder</p> <p>Cone</p> <p>Sphere</p>

Platonic Solids

There are **Five** Basic Platonic Solids.

<p>A Tetrahedron has ___4___ faces, ___4___ vertices, and ___6___ edges.</p>	
<p>A Cube has ___6___ faces, ___8___ vertices, and ___12___ edges.</p>	
<p>An Octahedron has ___8___ faces, ___6___ vertices, and ___12___ edges.</p>	
<p>A Dodecahedron has ___12___ faces, ___20___ vertices, and ___30___ edges.</p>	
<p>An Icosahedron has ___20___ faces, ___12___ vertices, and ___30___ edges.</p>
