

Def. Polygon

A polygon is a closed figure formed by 3 or more coplanar segments such that:

- 1. The sides that share a common endpt. are noncollinear.**
- 2. Each side intersects exactly 2 other sides, but only at the endpts.**

Def. Convex Polygon

A polygon such that no line containing a side contains points in the interior of the polygon

Def. Concave Polygon

A polygon such that the line containing a side contains points in the interior of the poygon.

# of Sides	Name
3	Triangle
4	Quadrilateral
5	Pentagon
6	Hexagon
7	Heptagon
8	Octagon
9	Nonagon
10	Decagon
<i>n</i>	<i>n</i>-gon

Def. **Regular Polygon**

A convex polygon with all sides and all \angle 's \cong .

Def. Perimeter

The sum of the lengths of all of the sides of a polygon.

Def. Circumference

The distance around a circle.

Def. Area

The number of **square units** needed to cover a surface.

Triangle

$$P = b + c + d$$

$$A = \frac{1}{2}bh$$

Square

$$P = s + s + s + s$$

$$A = s^2$$

Rectangle

$$P = 2l + 2w$$

$$A = lw$$

Circle

$$C = 2\pi r$$

$$A = \pi r^2$$

Given Points:

P (-1,3)

Q (-3,-1)

R (4,-1)

Find the **Area** and
Perimeter of the figure.
